

Experience

Software Engineer @ Meta / Facebook

2024 — Present

Menlo Park, CA

On the *Messaging and Instagram API & Platform* team (twelve engineers), building and maintaining Meta’s **Messaging APIs** — Meta’s primary channel for monetizing social-media messaging, with an estimated revenue impact of over \$15M daily in 2025. My work includes:

- Building and maintaining the client-side experiences (iOS and Web) for API-messaging features on Messenger and Instagram.
- Designing and shipping new platform APIs for third-party developers such as **ManyChat** and **Pancake** — including the **Utility Messages API**, a new class of messages for notifications like appointment reminders and shipping updates, and the **Calling API**, which brings voice and video calling into third-party messaging experiences. Others include the **Page Integrity API**, **Lead Generation Ads**, **Generic Template**, and a **messaging media-processing pipeline**, among others.
- Partnering with cross-functional teams (product, design, data science and data engineering) to deliver features, read usage trends, and drive adoption.
- Mentoring a summer intern and a new member of the team.
- Carrying 24/7 platform ownership one week every ~3 months through the team’s immediate-response oncall (IROC) rotation.

Software Engineering Intern @ Meta / Facebook

Summer 2022

Menlo Park, CA

Worked on the *Ads Serving Reliability* team to harden Meta’s machine learning data pipelines for understanding user signal on ads, as Meta adapted its ML strategy to the limited data left after Apple’s iOS 14.5 cross-app-tracking restrictions. I:

- prototyped a closed-loop ML pipeline connecting Meta’s internal data stores to training and inference workflows and back to the apps as feedback;
- built a command-line utility for monitoring and controlling data throughput, letting ML engineers tune data rates to the scale of experimentation.

Education

Dartmouth College

2020 — 2024

Hanover, NH

Bachelor of Science in Mathematics and Computer Science

- Honors: King Scholar, Great Issues Scholar.
- Relevant coursework: Algorithms, Operating Systems, Database Systems, Machine Learning, Computer Vision, Computational Linguistics, Computer Architecture.
- Teaching Assistant for 5 CS courses: Object-Oriented Programming, Systems Engineering, Full-stack Web Development, Database Systems, Artificial Intelligence.

Y Combinator Startup School

2022

An in-person summer program on the early stages of founding a startup.

Highlights

Capstone project

Senior Design Challenge

Discite — In a team of five, designed and built a video-based educational social network — a mobile app, backend server, recommendation system, and a machine learning pipeline that semantically segments educational videos into atomic clips optimized for learning.

Publications

Dartmouth Undergraduate Journal of Science

- **Data-Driven Behaviour Change** — March 2021.
- **Technology in the Developing World** — November 2020.
- **Present and Future Trends in Space Exploration** — November 2020.

About me

Software engineer with extensive experience driving products **end-to-end** — from identifying partner needs and gaps to designing, building, and shipping the full solution and its client-facing experience across **both backend and frontend** (experienced with both Web and Mobile). I profile for performance bottlenecks and measure growth and adoption.

Technical skills

</> Languages

- Python Rust C C++
- Objective-C Swift Java
- TypeScript Hack/PHP Haskell
- x86 Assembly SQL Julia C#
- F#

🔗 Areas of Interest

- Design Computer Architecture
- Operating Systems Deep Learning
- Computer Vision Robotics
- Reinforcement Learning
